PRESENTATION

I'm french and I have about **10 years experience**. I mainly work with web technologies but during my studies, I instead used low-level languages such as C, C++ and a little bit of Java and .NET.

I started to make some websites at the beginning of 2000's. I **used various web technologies** which allow me to have a rather broad vision of what is possible to do in a browser.

Today, I **mainly use Javascript, Python and Perl under Linux environment**. I'm particularly focused on new Javascript technologies and the new ways to build single-page web applications.

I love to learn and challenge myself. I'm constantly seeking new ways to produce simpler and better **in order to improve myself**.

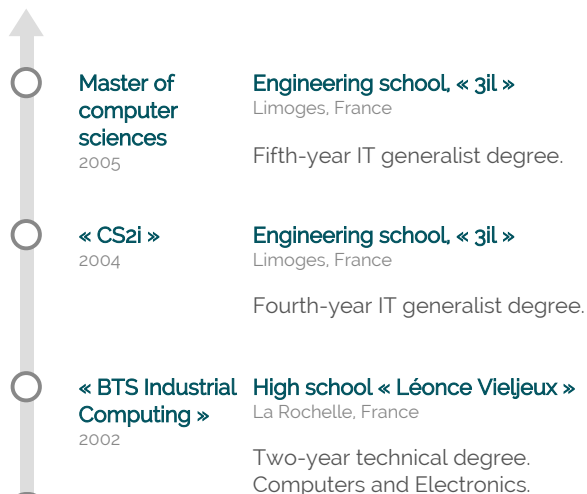

I like to be part of dynamic teams that are not afraid by the experimentations and **that are going forward**.

I like to build things with people, open and honest discussions, to share feelings, **to feel that people trust me and to know I can count of them**.

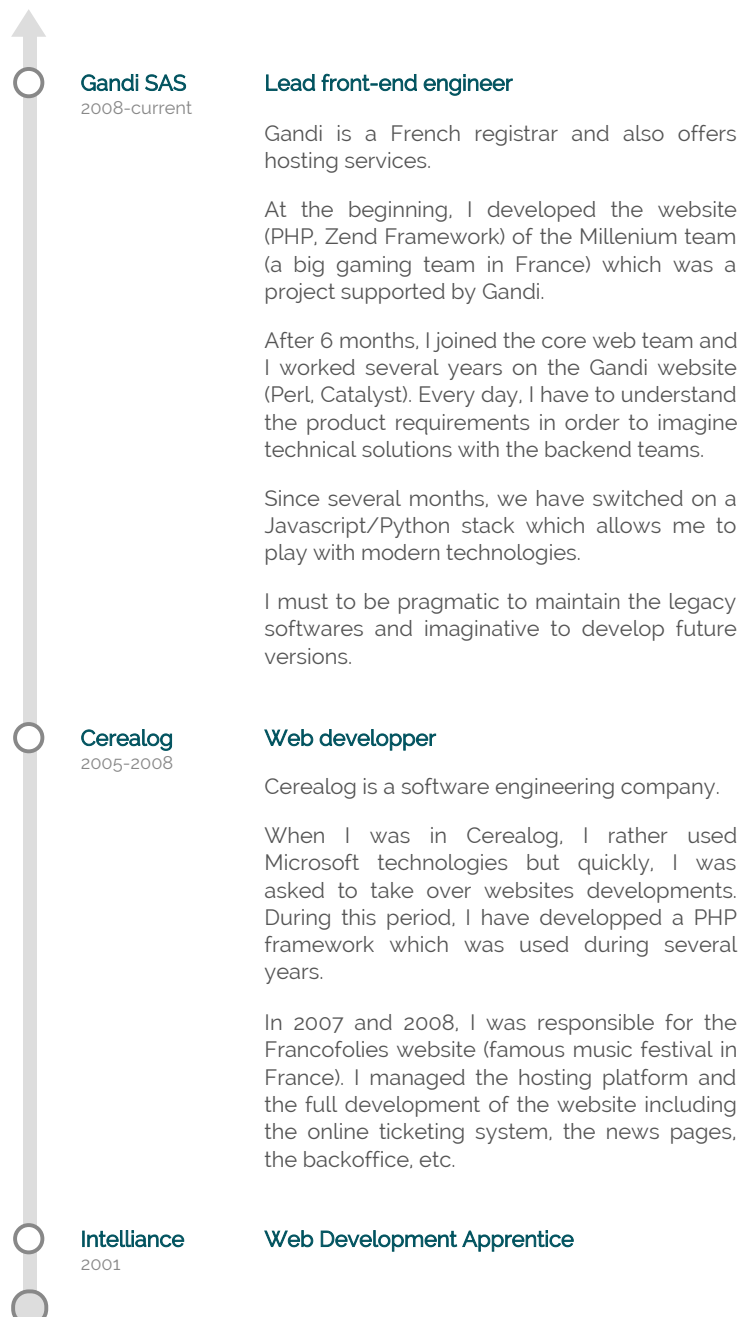

I also often participate to « meetups » in Paris about a lot of subjects to **keep eye opened** and to see what people are doing.

My MBTI psychological type is [INTJ](#).

node.js / AngularJS / sqlite

Mockify is the API mocking made easy.

Mockify allows to proxy REST API(s) and save everything that passing through it. Then, you can stop the proxy and start a mock that will serve the saved data.

It provides a cli, a webapp and is running as a daemon.

Python (Pyramid)

Because every CMS are complicated.

What's about a CMS with only 4 tables? This is what I tried to do within this little project built over Pyramid. I define « a node » as a piece of content and all pages are built recursively from these nodes.

A small website is using it: ascliberte.fr.

AngularJS / Python (Pyramid)

CaliOpen is an ambitious project whose the goal is to raise awareness about emails security.

I developed a proof of concept of a webapp to show the possibilities of what it is possible to do.
